

What is the Highland Heat Map?

It is both a **map** and associated **GIS tools** which brings together information on **heat demand**, **potential heat supply**, **skills & technology** and **opportunities and constraints** relevant to renewable heat opportunities

It is designed for use in a Geographic Information System (GIS) to provide added value through the provision of additional functionality:

- Interrogation
- Spatial analysis
- Modelling of development scenarios

Highland Heat Map

It is designed for use in a Geographic Information System (GIS) to provide added value through the provision of additional functionality. A short demonstration will explore the following:

- Review of each map theme & its layers
 - Heat Demand
 - Heat Supply
 - Skills & Technology
 - Opportunities & Constraints
- Map Scales/ Views

LIVE DEMONSTRATION

Heat Map - Summary

The Heat Map is made up of 5 themes, each one containing a number of theme related layers of information:

- Heat Demand
- Potential Heat Supply
- Skills/ Technology
- Opportunities/ Constraints
- Context

The map can be used at any scale and as the starting point for more complex analyses of potential renewable heat opportunities.
